**Abstract of DE4026153**

The bandage, dressing or support matrix consists of a biocompatible, open-pored plastic foam with a hydrogel embedded in the pores. The hydrogel is formed from a borate-modified Guar gum. The peptides which promote wound healing, preferably proteolytic enzymes, are bonded at least to the surface of the hydrogel via free hydroxyl and/or amino groups and bifunctional coupling reagents, and/or bactericidal or antimycotic substances are embedded in the hydrogel.
